

# Winning Space Race with Data Science

Elufidodo Gabriel 4th March, 2023

## Outline

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

## Executive Summary

- Summary of methodologies
  - Data Collection through API
  - Data Collection with Web Scraping
  - Data Wrangling
  - Exploratory Data Analysis with SQL
  - Exploratory Data Analysis with Data Visualization
  - Interactive Visual Analytics with Folium
  - Machine Learning Prediction
- Summary of all results
  - Exploratory Data Analysis result
  - Interactive analytics in screenshots
  - Predictive Analytics result

#### Introduction

#### Project background and context

Space X advertises Falcon 9 rocket launches on its website for 62 million dollars; other suppliers cost up to 165 million dollars each; much of the savings is due to Space X's potential to reuse the first stage. As a matter of fact, if we can predict whether the first stage will land, we can estimate the cost of a launch. This data can be used if another company wants to compete with Space X for a rocket launch. The project's goal is to build a machine learning pipeline that can predict whether the first stage will successfully land.

#### Problems you want to find answers

- What factors determine if the rocket will land successfully?
- What operating conditions needs to be in place to ensure a successful landing program

## Methodology

#### **Executive Summary**

- Data collection methodology:
  - Combined data from SpaceX public API and SpaceX Wikipedia page
  - Perform data wrangling
  - Classifying true landings as successful and unsuccessful otherwise
  - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - Tuned models using GridSearchCV

## Data Collection

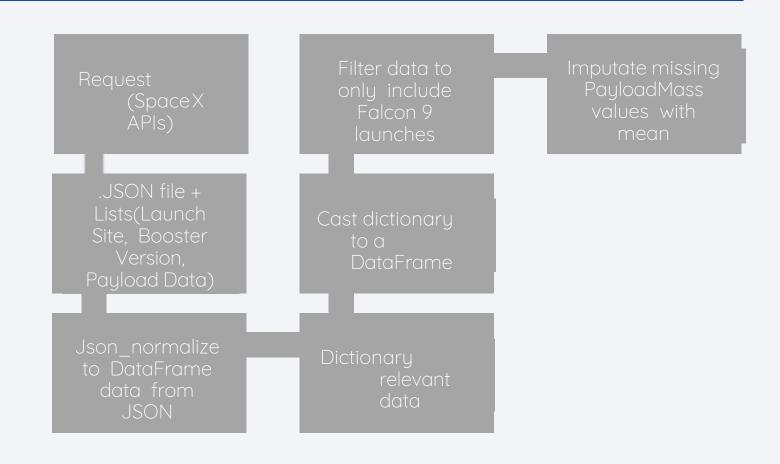

- The data was collected using various methods
  - Data collection was done using get request to the SpaceX API.
  - Next, we decoded the response content as a Json using .json() function call and turn it into a pandas dataframe using .json\_normalize().
  - We then cleaned the data, checked for missing values and fill in missing values where necessary.
  - In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
  - The objective was to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for future analysis.

## Data Collection - SpaceX API

## Data Collection— SpaceXAPI

#### GitHub url

https://github.com/elugabriel/dat a-science-capstoneproject/blob/main/Data%20Colle ction%20API.ipynb

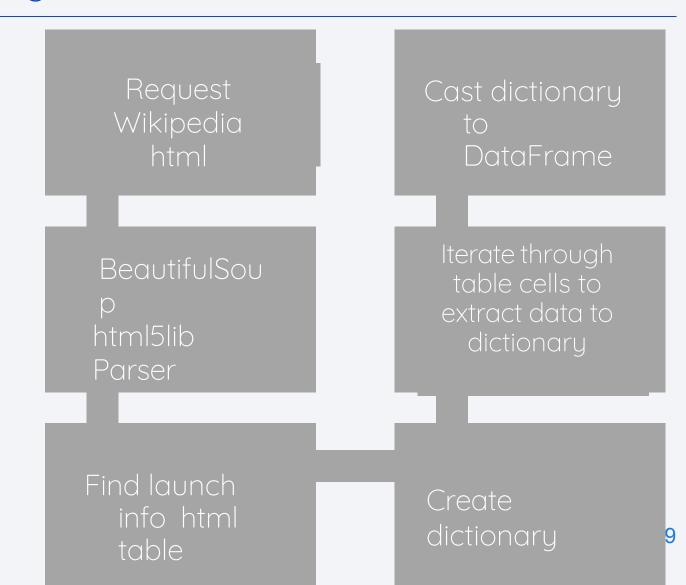

## Data Collection - Scraping

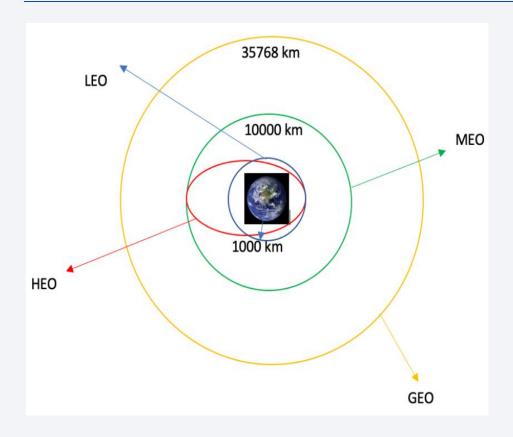

# Data Collection – Scraping

<u>GitHub url</u>

https://github.com/elugabriel/dat a-science-capstoneproject/blob/main/Data%20Colle ction%20with%20Web%20Scrapin g.ipynb

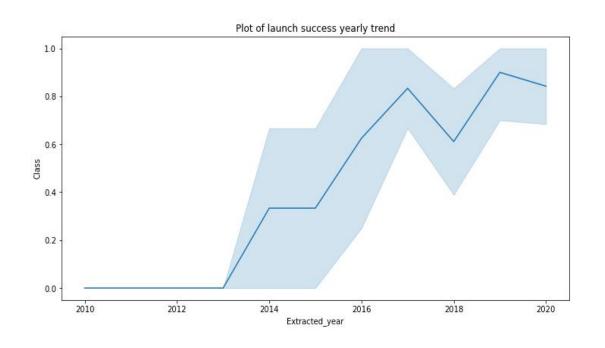

## Data Wrangling

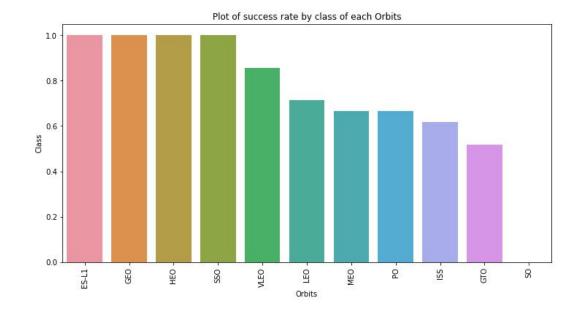

- Create a training label with landing outcomes where successful = 1 & failure = 0. Outcome column has two components: 'Mission Outcome' 'Landing Location'
- The number of launches at each site was determined as well as the number and occurrence of each orbits
- The landing outcome label from outcome column was generated and exported the results to csv.
- The link to the notebook is https://github.com/elugabriel/data-sciencecapstoneproject/blob/main/Complete%20the%20EDA%20l ab.ipynb

## EDA with Data Visualization

• Exploratory Data Analysis performed on variables Flight Number, Payload Mass, Launch Site, Orbit, Class and yearly trend.

 The link to the notebook is https://github.com/elugabriel/datascience-capstoneproject/blob/main/module\_2\_jupyterlabs-edadataviz.ipynb.jupyterlite.ipynb

## EDA with SQL

- We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
  - The names of unique launch sites in the space mission.
  - The total payload mass carried by boosters launched by NASA (CRS)
  - The average payload mass carried by booster version F9 v1.1
  - The total number of successful and failure mission outcomes
  - The failed landing outcomes in drone ship, their booster version and launch site names.
- The link to the notebook is https://github.com/elugabriel/data-science-capstone-project/blob/main/jupyter-labs-eda-sql-coursera\_sqllite.ipynb

## Build an Interactive Map with Folium

- All launch sites were marked, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- The feature launch outcomes (failure or success) was assigned to class 0 and 1.i.e., 0 for failure, and 1 for successAdd the GitHub URL of your completed interactive map with Folium map, as an external reference and peer-review purpose
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
  - Are launch sites near railways, highways and coastlines.
  - Do launch sites keep certain distance away from cities.
- The link to the notebook is <a href="https://github.com/elugabriel/data-science-capstone-project/blob/main/module\_3\_lab\_jupyter\_launch\_site\_location.jupyterlite.ipynb">https://github.com/elugabriel/data-science-capstone-project/blob/main/module\_3\_lab\_jupyter\_launch\_site\_location.jupyterlite.ipynb</a>

## Build a Dashboard with Plotly Dash

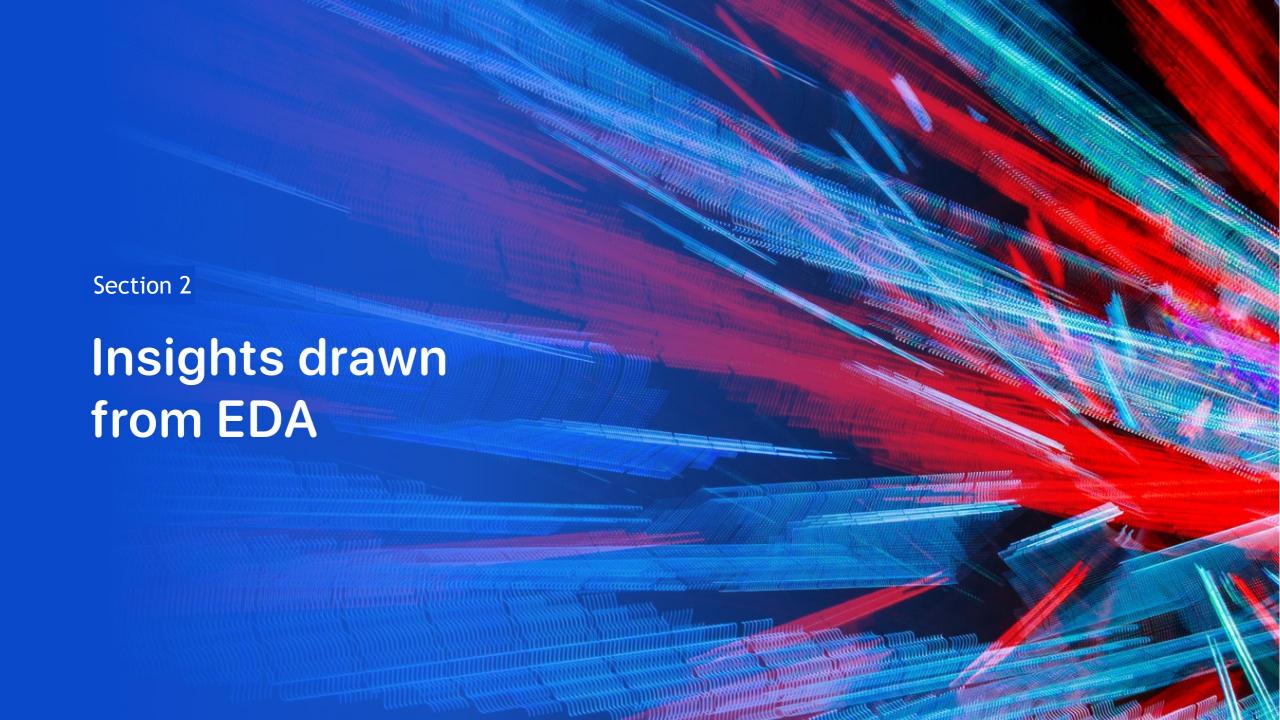

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- The link to the notebook is <a href="https://github.com/elugabriel/data-science-capstone-project/blob/main/dashboard.py">https://github.com/elugabriel/data-science-capstone-project/blob/main/dashboard.py</a>

## Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- The link to the notebook is <a href="https://github.com/elugabriel/data-science-capstone-capstone-project/blob/main/module 4 SpaceX Machine Learning Prediction Part 5.jupyterlite.ipynb">https://github.com/elugabriel/data-science-capstone-capstone-project/blob/main/module 4 SpaceX Machine Learning Prediction Part 5.jupyterlite.ipynb</a>

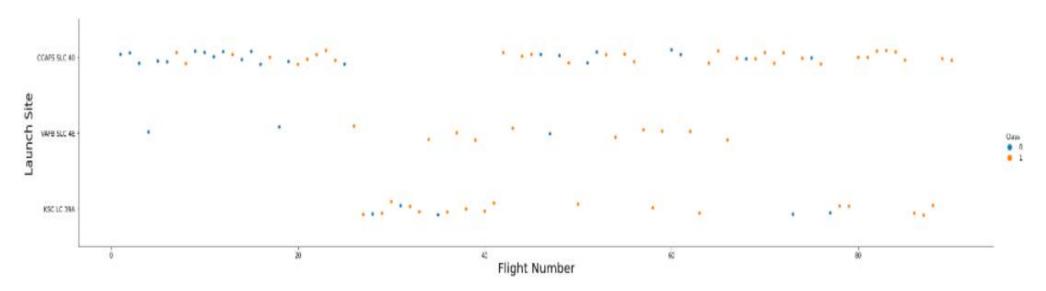

## Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

## Flight Number vs. Launch Site

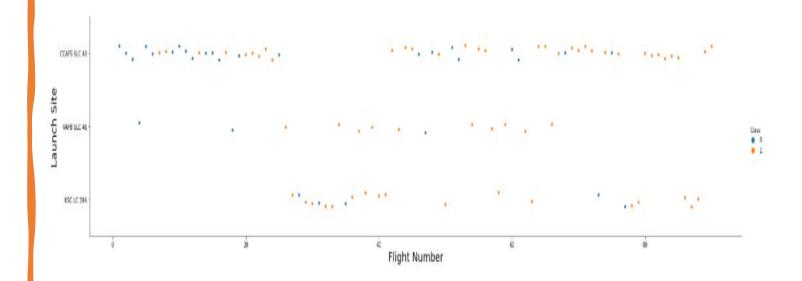

• From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

## Payload vs. Launch Site

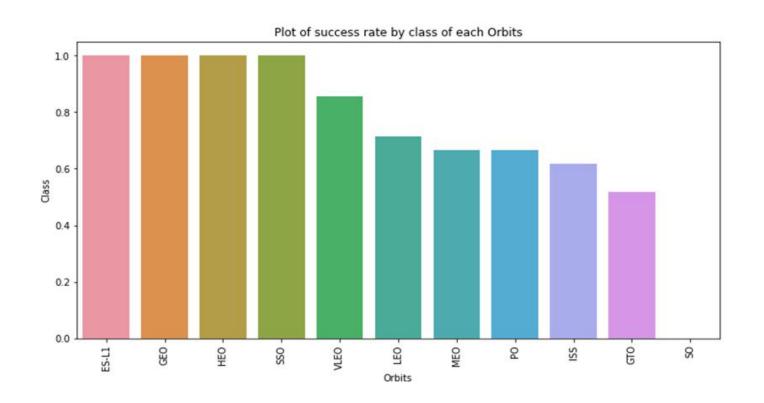

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

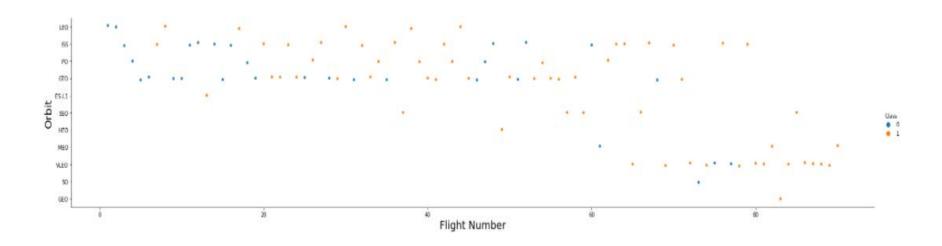

## Success Rate vs. Orbit Type

 From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

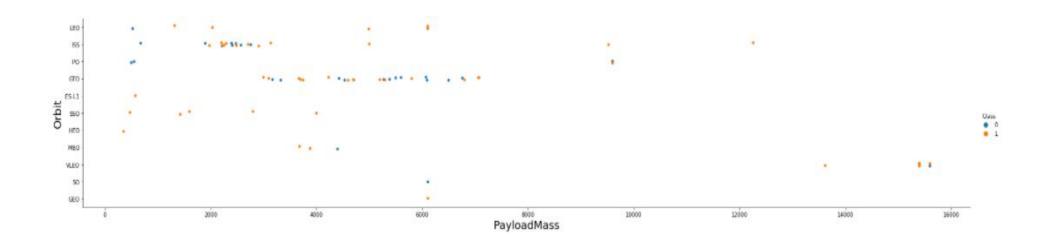

## Flight Number vs. Orbit Type

• The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

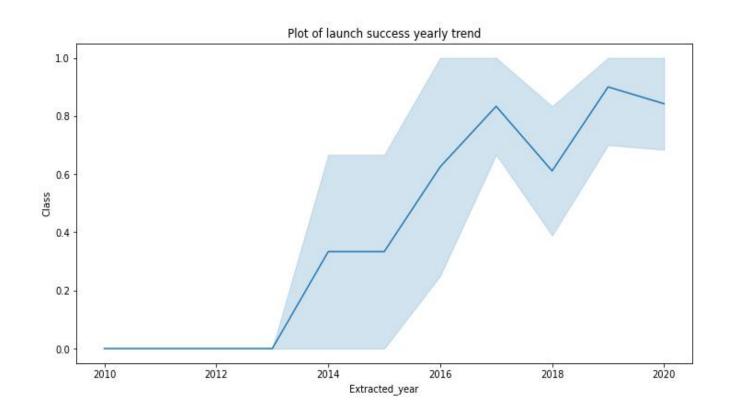

## Payload vs. Orbit Type

 We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

## Launch Success Yearly Trend

 From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

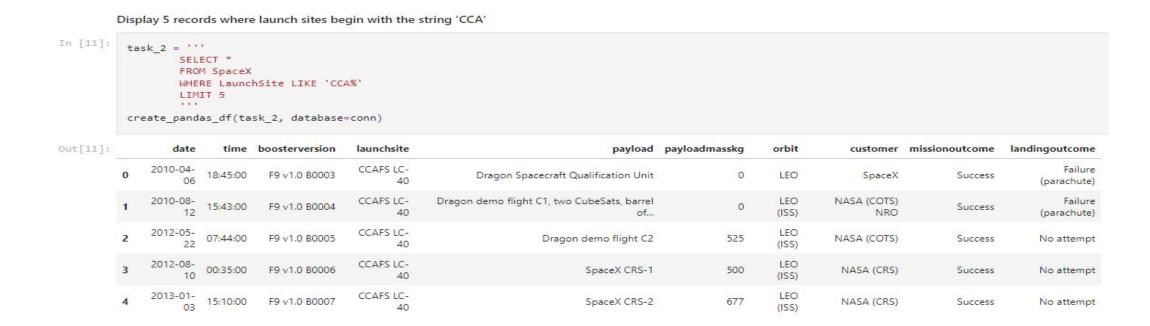

## All Launch Site Names

We used the key word
 DISTINCT to show only
 unique launch sites from the
 SpaceX data.

#### Display the names of the unique launch sites in the space mission

Out[10]:	launchsite		
	0	KSC LC-39A	
	1	CCAFS LC-40	
	2	CCAFS SLC-40	
	3	VAFB SLC-4E	

## Launch Site Names Begin with 'CCA'

 We used the query above to display 5 records where launch sites begin with `CCA`

## Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

#### Display the total payload mass carried by boosters launched by NASA (CRS)

## Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

#### Display average payload mass carried by booster version F9 v1.1

## First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22<sup>nd</sup> December 2015

# Successful Drone Ship Landing with Payload between 4000 and 6000

```
In [15]:

task_6 = '''

SELECT BoosterVersion
FROM SpaceX
WHERE LandingOutcome = 'Success (drone ship)'

AND PayloadMassKG > 4000
AND PayloadMassKG < 6000

'''

create_pandas_df(task_6, database=conn)
```

Out[15]: boosterversion

0 F9 FT B1022

1 F9 FT B1026

2 F9 FT B1021.2

3 F9 FT B1031.2

 We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

# Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

```
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task 7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create_pandas_df(task_7a, database=conn))
          print()
          print('The total number of failed mission outcome is:')
          create_pandas_df(task_7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]:
            failureoutcome
```

 We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

# Boosters Carried Maximum Payloa d

 We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function. List the names of the booster\_versions which have carried the maximum payload mass. Use a subquery

Out[17]:		boosterversion	payloadmasskg
	0	F9 B5 B1048.4	15600
	1	F9 B5 B1048.5	15600
	2	F9 B5 B1049.4	15600
	3	F9 B5 B1049.5	15600
	4	F9 B5 B1049.7	15600
	5	F9 B5 B1051.3	15600
	6	F9 B5 B1051.4	15600
	7	F9 B5 B1051.6	15600
	8	F9 B5 B1056.4	15600
	9	F9 B5 B1058.3	15600
	10	F9 B5 B1060.2	15600
	11	F9 B5 B1060.3	15600

## 2015 Launch Records

• We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

# List the failed landing\_outcomes in drone ship, their booster versions, and launch site names for in year 2015 In [18]: task\_9 = ''' SELECT BoosterVersion, LaunchSite, LandingOutcome FROM SpaceX WHERE LandingOutcome LIKE 'Failure (drone ship)' AND Date BETWEEN '2015-01-01' AND '2015-12-31' create\_pandas\_df(task\_9, database=conn) Out[18]: boosterversion launchsite landingoutcome 0 F9 v1.1 B1012 CCAFS LC-40 Failure (drone ship)

F9 v1.1 B1015 CCAFS LC-40 Failure (drone ship)

# Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

Out[19]:		landingoutcome	count
	0	No attempt	10
	1	Success (drone ship)	6
	2	Failure (drone ship)	5
	3	Success (ground pad)	5
	4	Controlled (ocean)	3
	5	Uncontrolled (ocean)	2
	6	Precluded (drone ship)	1
	7	Failure (parachute)	1

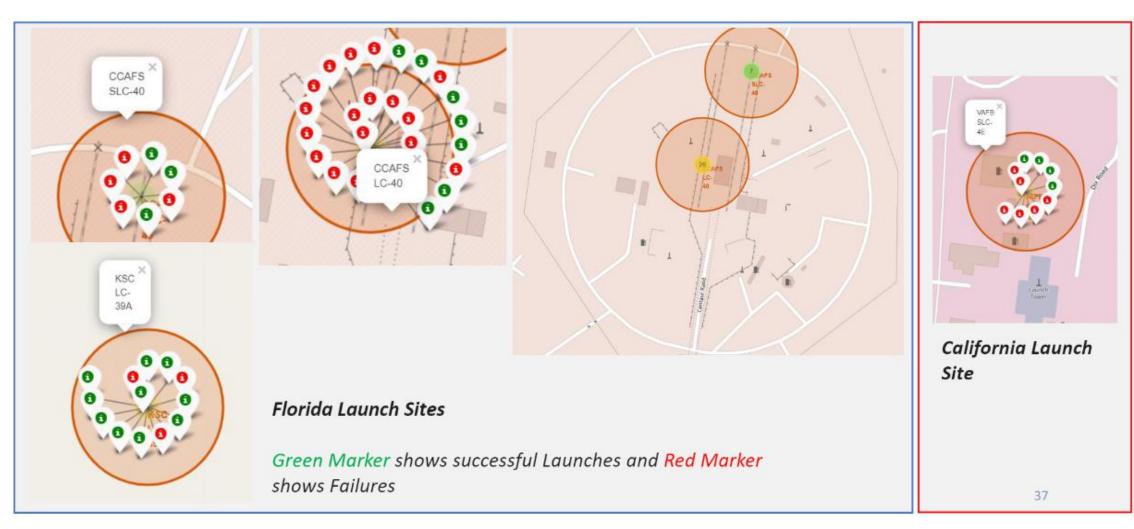

- We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN 2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcome in descending order.

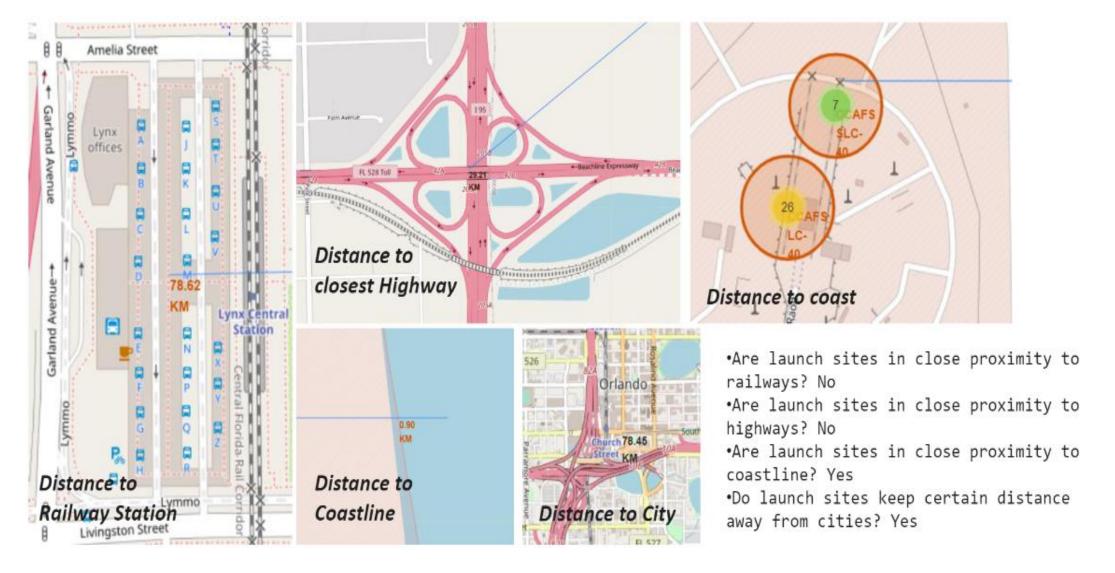

## All launch sites global map markers

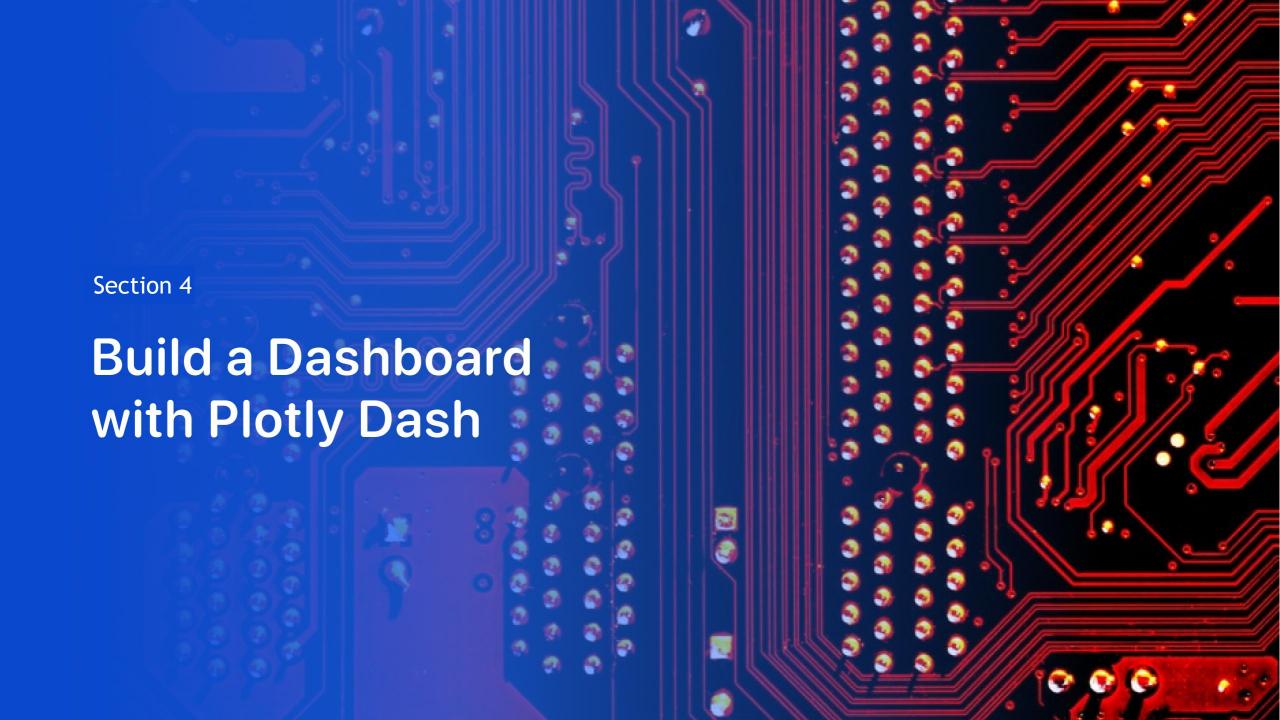

## Markers showing launch sites with color labels

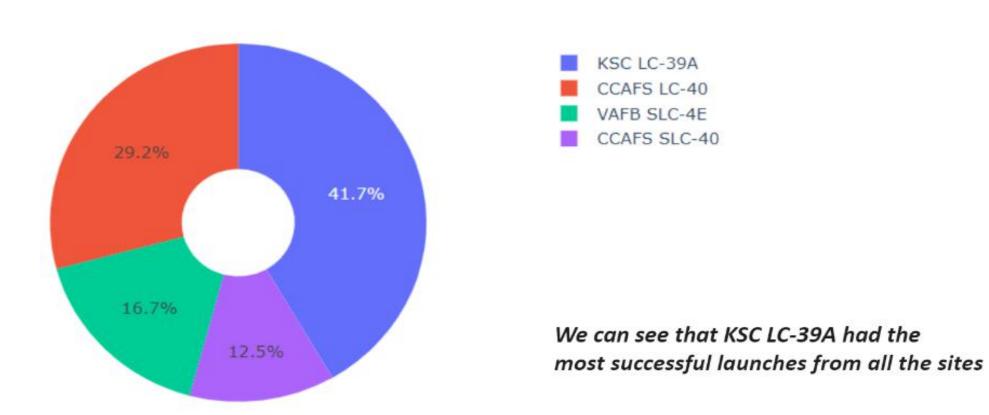

## Launch Site distance to landmarks

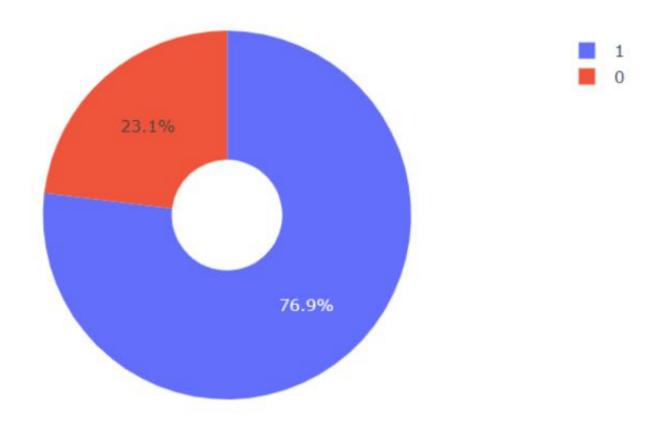

#### Pie chart showing the success percentage achieved by each launch site

#### Total Success Launches By all sites

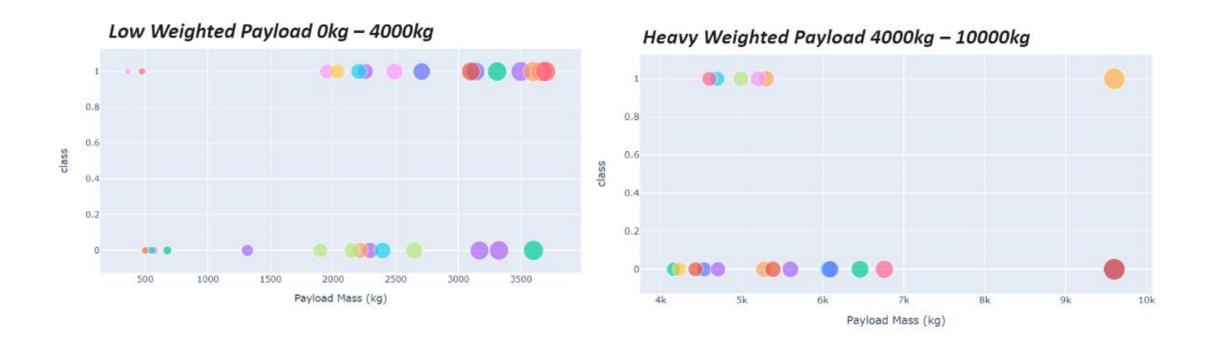

### Pie chart showing the Launch site with the highest launch success ratio

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

## Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

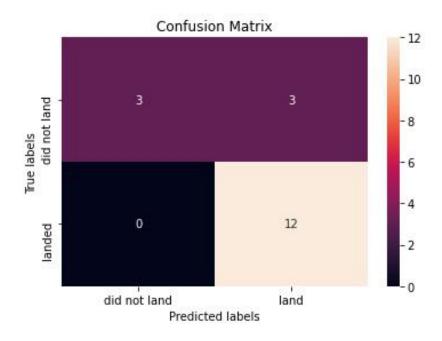

# Classification Accuracy

 The decision tree classifier is the model with the highest classification accuracy

```
models = { 'KNeighbors':knn cv.best score ,
              'DecisionTree': tree cv.best score ,
               'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm cv.best_score_}
bestalgorithm = max(models, key=models.get)
print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree cv.best params )
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn cv.best params )
if bestalgorithm == 'LogisticRegression':
     print('Best params is :', logreg cv.best params )
if bestalgorithm == 'SupportVector':
    print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}
```

## Confusion Matrix

 The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

## Conclusions

#### We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.
